

# COMP 4350 Project Iteration 1

## Group I (ConnectR)

### Implementation:

(3/11)

- Fully working features for the user stories planned for iteration 1. (2/6)

User story and development task are two different things. When you say user story, it should be in perspective of users.

Fill profile with basic information such as education, research interests/experience  
I should not be able to edit/delete other people's profile. I registered and I don't see my profile there. Profile should be associated with my own account. I should not be able to create multiple profile.

Limit search by criteria such as interests, institution, education/certifications

Not Implemented

Private Messaging

Send and receive private messages to and from other prof/students.

Not Implemented

Filter System

Create and save filters based on parameters such as username, location, field, etc.

Not Implemented

Live Activity of whom I'm following

Not Implemented

Display the live activity of other's (prof / student) whom I want to follow. An example of activity would be a professor whom I am following just shared a conference news or there is a vacant position in his lab.

Not Implemented

(-4)

Set the target for each iteration wisely. You mentioned a lot of user stories for Iter1 but did not implement those.

You should change ASP.NET's default Home/About/Contact pages. Those are not part of your project.

- Back-end unit tests (dependencies to UI, DB, or other classes should be stubbed/mockied out) (1/3)

You have only some default unit test that comes with the framework. You did not create test for the code you wrote. (-2)

- At least one integration test per detailed story **(0/2)**

You have three unit test but those are for asp.net's default Home/About/Contact pages.  
 You have 1 unit test regarding create profile but that was commented. I run it but it failed.  
*Test method ConnectR.Tests.Controllers.ConferenceControllerTest.Create threw exception: System.InvalidOperationException: No connection string named 'Entities' could be found in the application config file.*

This is because of your unit test project's poorly configured app.config file. Copying the content of web.config to the app.config will solve this issue. See previously provided sample project from github to know more about it.

No other test found

(-2)

### Design:

**(5/9)**

- Good programming practices **(2/2)**
- Proper design patterns **(2/3)**

You should NOT implement your business logic in Controller. (-1)

- Architecture sketch showing high-level components/services and the important relationships between them plus some important classes within components. **(1/4)**

There is no such sketch instead of only the relational model (-3)

### Planning:

**(0/5)**

- Team's communication and members' contributions **(0/3)**

You should provide actual communication log otherwise, we cannot verify if you are really communicating with each other or not. Your document should also say who is doing what. There should be a proper explanation If somebody fails to do what he was assigned to so. If you are using any messaging tool, do not forget to share the link.

- Following the plan **(0/2)**

You did not provide any user stories for iter2. Remember, you have to provide user stories, not development task. (-2)

### Total

**(8/25)**
